People's Behavior Drives Economics, Not the Reverse

When one's normal behavior has been constrained, whether through isolation, illness, immobility, or work, when the constraining factor is removed most people respond exuberantly to the sudden freedom as they return to their normal behavior.

During the recent Covid imprisonment people coped to some extent through online purchases, home food deliveries, and binge television viewing. This was enabled by businesses who adapted by changing their business models to ones that would accommodate their customers in this new situation.

In the new post-Covid surge, consumers have reordered their buying behavior towards the experiences that were denied to them during the pandemic.

Dining out, travelling, going on cruises, all have seen surges since the lockdowns have ended.

Some businesses may have had trouble returning to their pre-Covid models, though others may have benefitted. Dine-in restaurants that added delivery and greatly increased their take-out business during Covid could still derive additional business from those expanded services even though Covid has ended. Businesses that reduced in-house staffs, may never replace them, but may derive more work from fewer employees even though it might be at higher cost per hour.

These changes could lead to an economy with different defining metrics from those we previously measured.

With banks still paying low rates on ordinary deposits, but proportionately much higher rates on CD's and time deposits, the measure of money

supply as well as the velocity of short-term deposits could be more important than previously.

Returns on cash deposits at banks may have been almost ignored by investors over the last few years, but this could change as the FOMC continues to raise the fed funds rate from its current rate of 5%.¹

These recent high rates, along with the current media induced perception of bank weakness, could start to affect consumer behavior.

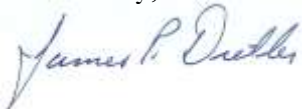

If investors start to take advantage of these timely rates, as well as curbing their current spending, it could reduce the velocity of money, slowing the economy and creating the slower growth environment which could include the lower inflation rate that the Fed is trying to achieve.

This could also be considered an example of the consumer driving the economy, the opposite of 'central planning' even though 'the Fed' as part of the central government certainly contributed.

As always, these actions could, in my opinion, lead to various opportunities that may fit your personal financial objectives.

Please call to discuss those that may be applicable.

Sincerely,

James P Dretler

Investing in commodities, futures and options on futures contracts entails significant risks. Prices of futures and options on futures contracts may be affected by a variety of factors at any time, including but not limited to, (i) changes in supply and demand relationships, (ii) governmental programs and policies, (iii) national and international political and economic events, war and terrorist events, (iv) changes in interest and exchange rates, (v) trading activities in the underlying assets or commodities and related contracts, (vi) pestilence, technological change and weather and (vii) the price volatility of a commodity or asset. In addition, the futures markets may be subject to temporary distortions or other disruptions due to various factors, including lack of liquidity, participation of speculators and government intervention

The securities/instruments discussed in this material may not be appropriate for all investors. The appropriateness of a particular investment or strategy will depend on an investor's individual circumstances and objectives. Morgan Stanley Wealth Management recommends that investors independently evaluate specific investments and strategies and encourages investors to seek the advice of a financial advisor.

Equity securities may fluctuate in response to news on companies, industries, market conditions and the general economic environment.

Companies cannot assure or guarantee a certain rate of return or dividend yield; they can increase, decrease or totally eliminate their dividends without notice.

Investing in smaller companies involves greater risks than those associated with investing in more established companies, including significant stock price fluctuations and illiquidity.

Bonds are subject to interest rate risk. When interest rates rise, bond prices fall; generally, the longer a bond's maturity, the more sensitive it is to this risk. Bonds may also be subject to call risk, which is the risk that the issuer will redeem the debt at its option, fully or partially, before the scheduled maturity date. The market value of debt instruments may fluctuate and proceeds from sales prior to maturity may be more or less than the amount originally invested or the maturity value due to changes in market conditions or changes in the credit quality of the issuer. Bonds are subject to the credit risk of the issuer. This is the risk that the issuer might be unable to make interest and/or principal payments on a timely basis. Bonds are also subject to reinvestment risk, which is the risk that principal and/or interest payments from a given investment may be reinvested at a lower interest rate.

Morgan Stanley and its Financial Advisors do not provide tax or legal advice. Individuals should seek advice based on their particular circumstances from an independent tax or legal advisor.

Morgan Stanley Smith Barney LLC is a registered Broker/Dealer, Member SIPC, and not a bank. Where appropriate, Morgan Stanley Smith Barney LLC has entered into arrangements with banks and other third parties to assist in offering certain banking related products and services.

The Dow Jones Industrial Average is a price-weighted average of 30 blue-chip stocks that are generally the leaders in their industry.
